

Lecture 6 - Physics Subsystem

“Part 1. Particle Physics” - Ian Millington

- ▶ Vector maths
- ▶ Game object interaction
- ▶ Physics rules: mostly fake
- ▶ Approximations / performance

Last Week Recap

- ▶ ECS and game world

Objective

- ▶ Mainly to give you a bit of taste for physics breadth in game dev
- ▶ Don't worry if you don't understand *all* of it: awareness is the key
- ▶ The engine takes care of most things for us . . . oh, wait a minute!

Game Dev Maths

- ▶ Fundamental to the field
- ▶ Ranges from basic to very complex
- ▶ Important to know the difference between what, why and how

2D Maths

- ▶ Luckily, not very complex
- ▶ Transitive skills from / to UI design
- ▶ Examples to consider: Arx Fatalis, Sony PS3, Valve games

Point

- ▶ Ordered pair: (x, y)
- ▶ Location / position in space
- ▶ Extendible to n dimensions
- ▶ Crucial to most games

Game World vs Screen

- ▶ Positive Y axis
- ▶ Not always 1 to 1 mapping
- ▶ Visible area (viewport into *infinite* world)

Point (Use Case)

- ▶ Distance to things
- ▶ Relative position to things

Activity

1. Construct a 4D point, where 4th component is time.
2. Can you design a game where a 4D point is used in gameplay?

Vector

- ▶ Ordered pair: (x, y) - yes, same as point
- ▶ Displacement with direction and length (magnitude)
- ▶ Describes velocity, acceleration, direction, etc.
- ▶ Extendible to n dimensions

Vector (Use Case)

- ▶ Distance to things (recall point)
- ▶ Direction of an object
- ▶ Force / speed via length
- ▶ Angle representation

Activity

Identify which part of ArxLibertatis code handles random vectors.

Transformations (Translate)

- ▶ Means move
- ▶ Apply over time to create a moving animation
- ▶ Apply with acceleration to simulate movement

Transformations (Scale)

- ▶ Means growing or shrinking
- ▶ Apply over time to create an animation
- ▶ Changes object dimensions (note for collisions)

Transformations (Rotate)

- ▶ Means changing angle
- ▶ Apply over time to create a spinning animation
- ▶ Changes occupying space (note for collisions)

Activity

1. Create (on paper or in code) a moving animation using point and vector concepts.
2. Apply acceleration
3. Apply gravity

Interpolations (Demo)

Changing the rate of change. Only a demo in this lecture, the concepts will be covered later.

Physics - Representing Game Objects

- ▶ Objects have dimensions, e.g. width, height, depth
- ▶ Objects have an *anchor* (position)

Game Physics

- ▶ Speed matters (functions get called many times in one frame)
- ▶ Need not be precise, just good enough
- ▶ Can utilise game specifics (e.g. platformer, tile based)

Collision Detection Phases

- ▶ Broad phase
- ▶ Narrow phase

AABB (Axis Aligned Bounding Box)

- ▶ Very fast
- ▶ Very easy to implement
- ▶ Extends to n dimensions
- ▶ Works in cases without rotations

Activity

Identify which part of the FXGL code base performs AABB.

High-level Implementation

Suppose we have n entities, how can we implement collision detection for all of them?

SAT (Separating Axis Theorem)

- ▶ Slower
- ▶ Easy to implement
- ▶ Extends to n dimensions
- ▶ Works in cases with rotations

Activity

Identify which part of the FXGL code base performs SAT.

Grids

- ▶ Fast
- ▶ Easy to implement
- ▶ Extends to n dimensions
- ▶ Works in tile / grid based cases, as broad phase

Space Partitioning (e.g. Quadtree)

- ▶ Speed depends on use case
- ▶ Harder to get “right”
- ▶ Extends to n dimensions
- ▶ Works only as broad phase

Pixel-level / Bitmap

- ▶ Very slow
- ▶ Relatively easy to implement
- ▶ Works only in 2D
- ▶ Works in cases with rotations

Continuous / Sweeping

- ▶ Slower
- ▶ Harder to get “right”
- ▶ Extends to n dimensions
- ▶ Mainly for fast moving objects or simulations

Special Cases

- ▶ Circle-circle collision
- ▶ Polygon clipping

Activity

1. Add two entities to your game demo and make them collide.
2. Handle collision by printing “Collision” to console or similar.

High-level Usage

Old school

```
if (obj1.collidesWith(obj2)) {  
    // do smth  
}
```

Modern

```
addHandler(type1, type2, (obj1, obj2) -> {  
    // do smth  
})
```

Conclusion

- ▶ Physics and maths are very important for games
- ▶ Don't have to get exactly right
- ▶ Cheap and cheerful algorithms exist

Further Reading

- ▶ Good SAT tutorial
